

Scenario 1: Search Functionality

Weak Prompt:

- Test the search feature.

Response for Weak Prompt:

I would be happy to test that out for you, but it looks like the Google Search tool is currently disabled because you haven't consented to its use.

To get it up and running, you'll just need to head over to your Gemini App settings and connect the tool. Once you've enabled it, let me know and we can give it a spin!

ICEPOT Prompt:

- Act as a Senior Manual QA Engineer. Generate manual test cases for the search functionality of an e-commerce website. Users can search products by name, category, and brand, and can apply filters and sorting options. Include positive, negative, empty search, partial keyword, filter, sort, and performance-related scenarios. For example, verify that searching for "iPhone" displays relevant products. Present the output in a table with Test Case ID, Scenario, Steps, and Expected Result. Use a professional and technical tone.

Response for ICEPOT Prompt:

Here is a comprehensive manual test suite designed for the e-commerce search functionality. Structuring these cases with clear, deterministic steps and expected results not only aligns with standard ISTQB foundation principles but also creates a highly robust baseline for eventually transitioning these manual execution steps into a Python-based automation framework.

Search Functionality Test Suite

Test Case ID	Scenario	Steps	Expected Result

TC_SEARCH_001	Positive: Exact Product Name	1. Navigate to the homepage. 2. Click the search bar. 3. Enter an exact product name (e.g., "iPhone 15 Pro"). 4. Click the search icon or press 'Enter'.	The search results page loads successfully, displaying the exact product at the top of the grid, followed by highly relevant accessories.
TC_SEARCH_002	Positive: Category Search	1. Enter a valid category name (e.g., "Laptops"). 2. Execute the search.	The results page populates exclusively with products tagged under the "Laptops" category across various brands.

TC_SEARCH_003	Positive: Brand Search	1. Enter a valid brand name (e.g., "Samsung"). 2. Execute the search.	The system returns a list of products exclusively manufactured by "Samsung," sorted by default relevance.
TC_SEARCH_004	Partial Keyword Search	1. Enter a partial keyword (e.g., "lapto" or "iPh"). 2. Execute the search.	The search engine correctly utilizes wildcards or predictive matching to return "Laptops" or "iPhones", handling the substring accurately.
TC_SEARCH_005	Empty Search Submission	1. Leave the search input field completely blank. 2. Click the search icon or press 'Enter'.	The system either disables the search trigger, retains the user on the current page, or prompts a validation message: "Please enter a search term."

TC_SEARCH_006	Negative: Non-existent Product	1. Enter a random alphanumeric string with no inventory match (e.g., "Xyz123Qwe"). 2. Execute the search.	A "0 results found" page is displayed along with a user-friendly message. Alternative product suggestions or categories are gracefully recommended.
TC_SEARCH_007	Negative: Special Characters	1. Enter special characters and symbols (e.g., "@#\$%^&*()"). 2. Execute the search.	The system handles the input without throwing application or database errors (e.g., 500 Internal Server Error). It should return "0 results found."
TC_SEARCH_008	Search + Filter Application	1. Search for a broad term (e.g., "Shoes"). 2. Wait for results to load.	The results grid dynamically updates to display only "Shoes" that strictly fall within the selected \$50 - \$100 price boundary.

		3. Apply a price filter (e.g., "\$50 - \$100").	
TC_SEARCH_009	Search + Sort Execution	1. Search for a valid product category. 2. Select "Price: Low to High" from the sorting dropdown.	The UI refreshes to display the searched products in ascending order based on their current active price.
TC_SEARCH_010	Performance: Load Time	1. Enter a highly generic term yielding thousands of results (e.g., "Clothing"). 2. Execute the search and monitor the network tab.	The First Contentful Paint (FCP) and complete search results render within the acceptable SLA (e.g., < 2.0 seconds).

TC_SEARCH_011	Boundary: Max Character Length	1. Paste a string exceeding the defined character limit (e.g., 256+ characters). 2. Attempt to execute the search.	The input field truncates the string at the maximum allowed boundary, or the system safely processes the query without crashing or exposing SQL/XSS vulnerabilities.
